What is PMCI?

PMCI (Paint Materials Cost Importer) sends paint material costs from your paint machine in to Summit. Once it is set up there are no timers or triggers. Once paint material costs data is exported in to a folder, you simply “send” the data in to Summit and it merges with the appropriate RO in screens 500-Vendor Costs, and 503-Analysis.

PMCI currently interfaces with: BASF, PPG, and AKZO Paint.

Setup:

PMCI is set up on the paint scale machine with a shortcut to the desktop. Double click on the shortcut and set up the following:

1. Choose the “Mix System Provider”

2. Set the “Cost Export Folder” path. NOTE: this is the folder where your paint scale machine will export data. i.e.: C:\PMCI\Export → Please contact your paint company to set up this export.

3. Set the Summit “DBServer Data” path by clicking on the blue link. NOTE: this path MUST point to the network drive that has the Summit DBServer\Data folder. I.e.: Z:\DBServer\Data → This network path must have full read\write permissions to the server.
Sending Costs To Summit:

Each time, after you have mixed paint and exported data, double click on the PMCI shortcut and launch the application. You will see the data ready to be sent in the “data list.”

Highlight the data to be sent and click the “Load and Update” button. This will send the “costs” into Summit. You will know the costs have been sent when you see the checkbox “checked” and the “Result” column will show a NEW cost record has been posted.

If a costs has already been sent THIS will be the result:
Your IT person should be to resolve the network path issues.

What You Will See in Summit:

Costs will be imported in to screen 500-Vendor Costs for the appropriate RO.
And screen 503-Analysis for the appropriate RO.
